For instance, you can design a pipeline by dragging and configuring objects like sections, rings, junctions and straight edges. In some cases, it is possible to use a freehand line to position objects. Moreover, you can modify an existing object, such as a section, to change the length, width and angle of the section. Also, the order of the objects in the drawing can be modified by re-arranging them in the drawing canvas. Objects can also be named and color-coded, and you can add comments to the objects and other drawings. The macro (among other things) looks to see if the first column is blank, and if it is, it fills it with a formula. This works perfectly. However, I'd like it to also check the second column, and if that column is also blank, then it should fill that column with the same formula. I've tried to nest the same first IF statement inside the second IF statement, but it just doesn't work. It gives me a "Subscript out of range" error on the line .Range("B" & Cells(r, c).row).Formula = "=A1" and I can't figure out what to do to get it to work. Any suggestions? Thanks! Sub ClearFormulas() Dim r As Long, c As Long, r2 As Long, c2 As Long r2 = Sheets("Questions").Range("A" & Rows.Count).End(xlUp).row For r = r2 To 1 Step -1 For c = 1 To Sheets("Questions").Cells(r, Column a1d647c40b

Your picture reminds me of my ex-boyfriend's best friend and she is a really mean girl. I am 100% sure that she is a lesbian and is just screwing around with him. She is too scared to do something with him. He really was an idiot for dating her and I told him so. I always warned him about her and how she was after him. I think his best friend and I are the only reason why he broke up with her. I hope she stops being so mean and stays away from him and that he realizes what a stupid idiot he was. I don't know if you feel the same way I do but when I meet people that are extremely young(somewhere between 15-20) the last thing I look for is someone that is more mature. I think they are far more immature and immature then older people.Q: what is the difference between Using, and static constructor class Test { public static Test() { Console.WriteLine("Test"); } static void Main(string[] args) { Test.Test(); } } what is the difference between using and static constructor in this code A: If you run this code, it will print Test but if you comment the static Test() {... } it will throw an error. You can access the Test() method of the static constructor (because it is defined within Test) but you cannot access the Test() method of

With Markup Import and Markup Assist, you can now instantly create PDF or paper-based responses to client requests or feedback and incorporate the information into your design workflows. Incorporate Point-in-Time documentation Scan and add documents to your drawings, or even animate the scan of a physical item to make more real-time, high-fidelity documentation. (video: 1:30 min.) With Point-in-Time documentation, you can now scan physical items to easily add them to your design or add related information to your files. Drawings are no longer the only way to document your designs.
